The trend-setting Tuby system is now evolving into a new proposal
Animè: elegance, colour and minimalist design by Arblu

Another important innovation to be presented at Cersaie 2022 concerns the **Tuby System** project, which is enriched with **Animè** and **Animè washbasins**, also signed by the Arter&Citton studio.

Animè and Animè handwash unit are unique pieces with a minimal style but a strong personality, designed to respond to the current market demand oriented towards design, attractive and functional one-piece solutions.

Tuby system, the result of articulated and complex research, is composed of 19 joints and 7 tubular elements of different types and lengths, in aluminium in Alublack finish, giving rise to multiple configuration possibilities, and the two new products are its latest evolution.

Animè and Animè handwash unit are available in the Ring version, a suspended solution where Tuby System surrounds the washbasin, and in the Telaio version, with the floor-standing tubular structure enriched by the insertion of a shelf in the lower part.

Animè has a choice of widths of 60, 70, 95 cm and a depth of 45.5 cm.

Animè handwash unit is a design proposal ideal for small spaces; in fact, it has a depth of 28 cm, while in width the available sizes are 35, 50 and 60 cm.

In both solutions it is possible to optionally insert towel racks, either frontal or side, which become an integral part of the structure.

The washbasins are made of Geablu and available in all 44 Arblu colours to create pleasant colour contrasts with the elegant Alublack frame structure. The washbasins combine a rigorous design with an interior softness that also takes functionality into account, thanks to the easy-to-clean edges.

The Animè version with a depth of 45.5 is a full-width basin with a sliding tray, which can be used as a shelf or as an option, with the drain in the same colour as the washbasin, with tap which can be positioned at the side or in the middle. The 28 deep version, for its technical configuration and optimal ergonomics, has the tap positioned to the side on the right.

The proposal is completed with the mirrors made with Tuby System, also carefully designed in detail, available in many dimensions, intended to be a coordinated complement, aesthetically minimal and technically functional. The mirrors have an integrated spot, backlight option, Blu Sensor on/off switch and integrated shelf. Shelf and spot can be positioned according to consumer preference.
